

BeutiBond

Light-curing, self-etching one-component adhesive **One component – One layer**

BeutiBond is an innovative “all in one” adhesive of the 7th generation, for bonding filling components to the natural enamel and dentine.

Comprising two monomers stable to hydrolysis, BeutiBond offers high initial and long-term stable attachment to enamel and dentine.

One single component allows you to reliably etch, prime and bond in less than thirty seconds. Laborious procedures such as shaking or mixing are completely dispensed with. You achieve a reliable and reproducible result. White discolourations of the gingiva are virtually excluded by the composition being free of hydroxyethyl-methacrylate.

The exceedingly low film thickness, amounting to less than 5 µm, leaves you plenty of space for highly aesthetic superstructures and is particularly well suited for small or shallow cavities.

BeutiBond is available as a 6 ml bottle and as a practical unit dose (50x 0.1 ml).

For further information visit us on our booth hall 1.0 / K040.
